

SPECIFICATION

Mitotic Kinesin Inhibitor

Technical Field

The present invention relates to a mitotic kinesin Eg5 inhibitor comprising a thiadiazoline derivative or a pharmacologically acceptable salt thereof as an active ingredient, which is effective in treatment of a disease associated with cell proliferation, for example, restenosis, cardiac hypertrophy, immunologic diseases, and the like.

Background Art

The mitotic kinesins are proteins that are involved in the mitotic spindle regulation; and play an essential role for progression of the mitotic phase in cell cycle. These proteins have a function of moving proteins along microtubules using the energy produced by ATP hydrolysis, and belong to a class of functional proteins generally called "molecular motors". In the mitotic phase, the proteins are deeply involved in extension and maintenance of mitotic spindles, as well as formation of structure called spindle pole body, and further, they regulate progression of normal cell division through the movement of chromosomes along the spindle microtubules.

The mitotic kinesin Eg5 is one of the mitotic kinesins constituting an evolutionarily conserved subfamily. It is known that Eg5 has a function as a bipolar homotetramer molecule, and is involved in the formation of the bipolar spindle structure by crosslinking two of microtubules of the same direction and moving them in the direction toward the + (plus) end to cause sliding of two of the antiparallel microtubules, thereby keep - (minus) ends of microtubules at a distance and separate spindle pole bodies. The above functions of Eg5 were elucidated on the basis of the analysis of the human cells treated with anti-Eg5 antibody and a specific inhibitor [Cell, Vol. 83, p.1159 (1995); J. Cell Biol., Vol. 150, p.975 (2000); Jikken Igaku (Experimental Medicine), Vol. 17, p.439 (1999)].

The gene of human Eg5 was cloned in 1995, and the expression of a full-length human Eg5 recombinant protein by using an insect cell and functional analysis using the resulting protein were reported [Cell, Vol. 83, p.1159 (1995)]. The gene was

registered in a public database as GenBank accession numbers: X85137, NM004523 and U37426. A biochemical analysis and structure analysis by crystallization of Eg5 utilizing an N-terminus portion of human Eg5, expressed by using *Escherichia coli* cells, were reported [J. Biological Chemistry, Vol. 276, p.25496 (2001); Chemistry & Biology, Vol. 9, p.989 (2002)], which applied a technique similar to the analysis utilizing Eg5 derived from *Xenopus laevis* having a high homology to the human Eg5 [Proc. Natl. Acad. Sci. USA, Vol. 96, p.9106 (1999); Biochemistry, Vol. 35, p.2365 (1996)].

As described above, the mitotic kinesin Eg5 is important as a target molecule of a novel mitotic phase acting agent and it is considered that an inhibitor against said molecule is promising as an agent for therapeutic treatment of diseases in which cell proliferation is involved (for example, restenosis, cardiac hypertrophy, arthritis, immunologic diseases, and the like) [WO01/98278; WO02/56880; WO02/57244; Trends in Cell Biology, Vol. 12, p.585 (2002)].

As compounds having inhibitory activity against the human Eg5 enzyme, monastrol [Science, Vol. 286, p.971 (1999)], quinazoline derivatives (WO01/98278), phenathiazine derivatives (WO02/57244), triphenylmethane derivatives (WO02/56880), dihydropyrimidine derivatives (WO02/79149; WO02/79169), dihydropyrazole derivatives (WO03/79973), and the like were reported.

Thiadiazoline derivatives having inhibitory activity against a transcription factor STAT6 activation or those having integrin antagonistic action are known (Japanese Patent Unexamined Publication (KOKAI) No. 2000-229959; WO01/56994), and further, those having an antibacterial activity, ACE inhibitory activity or the like are also known (WO93/22311; Japanese Patent Unexamined Publication (KOKAI) No. 62-53976; J. Bangladesh Chem. Soc., Vol. 5, p.127 (1992)).

Biological activities of a typical Compound (I) (Compound 1) will be specifically explained by the following test examples.

Test Example 1: Test for mitotic accumulation effect

The test for mitotic accumulation effect was carried out by referring to the literature [Nature, Vol. 392, p.300 (1998)]. Human colon carcinoma HCT 116 cells were cultured for 17 hours in the presence of Compound 1. Hoechst 33342 (Sigma Aldrich, Catalog No. B-2261) was added to the cells at a final concentration of 10 $\mu\text{mol/L}$, and the cells were left for 10 minutes to visualize chromosomes. Fluorescence and phase contrast images were observed using an inverted fluorescence microscope (NIKON CORP., Catalog No. TE300). Rounded cells with condensed chromosomes were regarded as mitotic cells. Mitotic index was expressed as the percentage of mitosis in total cells measured. The mitotic index of untreated cells was approximately 5%, whilst the mitotic index increased by the representative Compound 1 in a concentration-dependent manner, and at the concentration of 3 $\mu\text{mol/L}$, the mitotic index was approximately 70%. Further, the localization of the condensed chromosomes was different from that of the cells which is accumulated in the mitotic phase by the treatment of microtubule acting agent, and the characteristic phenotype that the localization of the condensed chromosomes distributed in a circular shape in the cells was observed.

The above result suggested that Compound 1 was a different class of mitotic phase acting agent from the microtubule acting agent.

Test Example 2: Analysis of a mitotic phenotype by immunocytochemistry

Analysis of a mitotic phenotype using immunohistochemistry was carried out by referring to the literature [Oncogene, Vol. 19, p.5303 (2000)]. Human lung cancer A549 cells were cultured for 17 hours in the presence of Compound 1. The cells were washed with phosphate-buffered saline (PBS) and then treated with cold methanol at -20°C for 1 minute to fix the cells. The cells were washed with PBS and then permeabilized with PBS containing 0.2% Triton-X for 15 minutes. After washing with PBS, the cells were blocked for 30 minutes with a blocking solution [PBS containing 1% fetal bovine serum] and allowed to react for 30 minutes with a primary antibody solution (blocking solution containing 0.2% monoclonal mouse anti- α -tubulin (Sigma Aldrich, Catalog No. T-9026) and 0.2% rabbit anti- γ -tubulin (Sigma Aldrich, Catalog No. T-3559). After washing with PBS, the cells were allowed to react for 30 minutes

with a secondary antibody solution (a blocking solution containing 0.025% Alexa Fluor 546-conjugated anti-mouse IgG antibody (Molecular Probe, Catalog No. A-11030), 0.5% Alexa Fluor 488-conjugated anti-rabbit IgG antibody (Molecular Probe, Catalog No. A-11034) and 1 μ mol/L Hoechst 33342) to visualize microtubules, centrosomes and chromosomes. Mitotic phenotypes were observed under the inverted fluorescence microscope. The cells accumulated in mitosis by Compound 1 showed characteristic phenotypes of monastral microtubule arrays, monopolar spindles, and circularly distributed localization of chromosomes. These mitotic phenotypes are the same as those of cells treated with neutralizing antibodies for Eg5 described in the literature [Cell, Vol. 83, p.1159 (1995)] or an Eg5 specific inhibitor, monastrol [Science, Vol. 286, p.971 (1999)].

The above results suggested that the representative Compound 1 inhibited Eg5.

Test Example 3: Eg5 enzyme inhibition test

A full length recombinant human Eg5 protein was prepared by referring to the literature [Cell, Vol. 83, p.1159 (1995)]. The *Spodoptera frugiperda* (Sf) 9 insect cells were infected with a baculovirus expressing a full length human Eg5 fused with a His tag at the N-terminus, and cultured. Then the culture medium was centrifuged to collect cell pellets. The cell pellets were suspended in a buffer, and the suspension was centrifuged to recover the supernatant. The supernatant was passed through a nickel agarose column to obtain the Eg5 fused with a His tag at the N-terminus as a partially purified sample.

Measurement of the ATPase activity of Eg5 was carried out by referring to the literature [EMBO Journal, Vol. 13, p.751 (1994); Proc. Natl. Acad. Sci. USA, Vol. 89, p.4884 (1992)]. A reaction solution was prepared which consisted of 25 mmol/L piperazine N,N'-bis(ethanesulfonate) (PIPES)/KOH (pH 6.8), 1 mmol/L ethylene glycol-bis(2-aminoethyl ether)tetraacetic acid (EGTA), 2 mmol/L $MgCl_2$, 1 mmol/L dithiothreitol (DTT), 100 μ g/mL bovine serum albumin (BSA), 5 μ mol/L paclitaxel, 25 μ g/mL tubulin (Cytoskeleton, Catalog No. TL238), 200 μ mol/L MESG substrate (2-amino-6-mercapto-7-methylpurine riboside) (Molecular Probes, Catalog Number E-6646), 1 U/mL purine nucleoside phosphorylase (Molecular Probe, Catalog No. E-6646) and 12.5 μ g/mL of the full length human Eg5 partially purified sample. The reaction solution containing serially diluted Compound 1 was added to each well of a

96-well plate. The enzymatic reaction was performed at 30°C for 30 minutes. Absorbance at 360 nm was measured using a plate reader (Molecular Device, SpectraMax 340PC³⁸⁴) as an index of the ATPase activity. The absorbance observed in the presence of Eg5 and absence of Compound 1 was defined 100%, and the absorbance observed in the absence of both Eg5 and Compound 1 was defined 0%. The relative activity was calculated to calculate the IC₅₀ value.

Compound 1 inhibited the ATPase activity of Eg5 in a concentration-dependent manner, and the IC₅₀ value was 2 µmol/L.

From the results of Test Examples 2 and 3, it was shown that Compound 1 has an inhibitory activity against Eg5.

Test Example 4: Eg5 enzyme inhibition test (2)

A recombinant human Eg5 motor domain protein was prepared by referring to the literature [Biochemistry, Vol. 35, p.2365 (1996)]. A plasmid expressing the motor domain of human Eg5 was constructed, and transformed into *Escherichia coli* BL21 (DE3). The transformant was cultured at 25°C, and when OD₆₀₀ reached 0.74, isopropyl-β-D-thiogalactoside was added at a final concentration of 0.5 mmol/L. The transformant was further cultured for 4 hours, and then the culture medium was centrifuged to collect the cells. The cells were suspended in a buffer and ultrasonicated, and then the sonicated solution was centrifuged to recover the supernatant. The supernatant was purified by cation exchange column chromatography to obtain a partially purified sample. Furthermore, the partially purified sample was purified by gel filtration column chromatography to obtain a finally purified sample.

Measurement of the ATPase activity of Eg5 was carried out by referring to the literatures [EMBO Journal, Vol. 13, p.751 (1994); Proc. Natl. Acad. Sci. USA, Vol. 89, p.4884 (1992)]. The following two kinds of solutions were prepared: Solution A consisting of 25 mmol/L piperazine N,N'-bis(ethanesulfonate) (PIPES)/KOH (pH 6.8), 1 mmol/L ethylene glycol-bis(2-aminoethyl ether)tetraacetic acid (EGTA), 2 mmol/L MgCl₂, 1 mmol/L dithiothreitol (DTT), 5 µmol/L paclitaxel, 167 µg/mL bovine serum albumin (BSA), 41.7 µg/mL tubulin (Cytoskeleton, Catalog No. TL238), 333 µmol/L MESG substrate (2-amino-6-mercapto-7-methylpurine riboside) (Molecular Probes, Catalog Number E-6646), 1.67 U/mL purine nucleoside phosphorylase (Molecular Probe, Catalog No. E-6646) and 1.33 µg/mL of the human Eg5 motor domain purified

sample, and Solution B consisting of 25 mmol/L piperazine N,N'-bis(ethanesulfonate) (PIPES)/KOH (pH 6.8), 1 mmol/L ethylene glycol-bis(2-aminoethyl ether)tetraacetic acid (EGTA), 2 mmol/L MgCl₂, 1 mmol/L dithiothreitol (DTT), 5 μmol/L paclitaxel and 2.5 mmol/L ATP. Solution A was dispensed into each well of a 96-well plate as 45 μL portions. Solution B was used to serially dilute a test compound. The diluted test compound solutions in a volume of 30 μL were mixed with Solution A added beforehand in each well of the 96-well plate to start the enzymatic reaction. The enzymatic reaction was performed at 30°C for 30 minutes. Absorbance at 360 nm, which serves as an index of the ATPase activity, was measured using a plate reader (Molecular Device, SpectraMax 340PC³⁸⁴). The absorbance observed in the presence of Eg5 and absence of the test compound was defined 100%, and the absorbance observed in the absence of both Eg5 and the test compound was defined 0%. The relative activity was calculated to calculate IC₅₀ value.

Compounds 1, 95, 97, 100, 104, 107, 111, 134, 152, 154, 171, 174, 176, 210, 221, 238, 264 and the like inhibited the ATPase activity of Eg5 in a concentration-dependent manner, and IC₅₀ values of the compounds were found to be 2 μmol/L or lower.

Compound (I) or a pharmaceutically acceptable salt thereof can be administered alone. However, usually, Compound (I) or a pharmaceutically acceptable salt thereof is preferably provided in various pharmaceutical preparations. Furthermore, these pharmaceutical preparations are used for animals and humans.

The pharmaceutical preparations according to the present invention may comprise Compound (I) or a pharmaceutically acceptable salt thereof alone as an active ingredient. Alternatively, the pharmaceutical preparations may comprise a mixture of Compound (I) or a pharmaceutically acceptable salt thereof with any effective ingredient used for another treatment. Furthermore, these pharmaceutical preparations are prepared by mixing the active ingredient(s) with one or more pharmaceutically acceptable carrier(s) and then employing any method well-known in the technical field of pharmaceuticals.

As for administration routes, it is preferred to select the most effective route of administration. Examples of the administration routes include oral administration and parenteral administration such as intravenous administration and the like.

As for the dosage form, for example, tablets, injections and the like are

included.

For example, the tablet suitable for oral administration can be prepared with, for example, excipients such as lactose and mannitol; disintegrants such as starch; lubricants such as magnesium stearate; binders such as hydroxypropylcellulose; surfactants such as a fatty acid ester; plasticizers such as glycerol; and the like.

Preparations suitable for parenteral administration preferably comprises of a sterilized aqueous preparation containing the active compound and being isotonic to blood of a recipient. For example, when an injection is prepared, a solution for injection is prepared by using a carrier consisting of a salt solution, glucose solution, a mixture of salt solution and glucose solution, or the like.

Also in these parenteral preparations, one or more kinds of auxiliary components selected from excipients, disintegrants, lubricants, binders, surfactants, plasticizers, diluents which are exemplified for the oral administration, preservatives, flavors and the like may be added.

Compound (I) or a pharmacologically acceptable salt thereof is generally administered systemically or locally in the form of an oral or parenteral preparation when used for the aforementioned purpose. The dose and the frequency of administration may vary depending on the administration form, the age and body weight of a patient, nature and severity of the condition to be treated, and the like. When oral administration is performed, generally 0.01 to 1,000 mg/kg, preferably 0.05 to 500 mg/kg per single administration for an adult may be administered once a day or a few times a day. When parenteral administration such as intravenous administration is performed, 0.001 to 1,000 mg/kg, preferably 0.01 to 300 mg/kg, per single administration for an adult may be administered once a day or a few times a day, or may be continuously administered intravenously for 1 to 24 hours a day. However, the dose and the frequency of administration may vary depending on the aforementioned various conditions and the like.

The present invention will be explained in detail with reference to the following examples and reference examples.

The spectra of proton nuclear magnetic resonance (^1H NMR) used in Examples and Reference Examples were measured at 270 or 300 MHz, and exchangeable hydrogen may not always be clearly observed depending on the compound and the measurement conditions. For the descriptions of the multiplicity of signals, those
